

March 20, 2026: A Testable Prediction of Planetary-Scale Resonance

🎯 Core Discovery

Analysis of 16 globally distributed sacred sites reveals **97.5%** of inter-site distances are integer multiples of 46.98 km with statistical significance $p < 10^{-15}$. This cannot be coincidence.

⚡ The Prediction

Date: March 20, 2026 (Vernal Equinox)

Time: 12:50 UTC (initiatory transient) → 14:36 UTC (global coherence)

Frequency: 46.98 Hz \pm 0.5 Hz

Mechanism: Solar-tidal forcing during Solar Cycle 25 maximum

📊 What Makes This Scientific

- Empirical foundation:** Geodetic precision with $p < 10^{-15}$
- Mainstream physics:** Uses standard seismology (Rayleigh waves at 1.26 km/s)
- Explicitly falsifiable:** Specific times, frequencies, locations
- Timestamped:** Published before the event date

📁 Repository Contents

- [Main Paper](March_20_2026_Prediction.md)** - Complete analysis with theory, predictions, and monitoring protocol
- [One-Page Summary](Executive_Summary.md)** - Quick overview for sharing
- Data** - Inter-site distance calculations and harmonic analysis
- Monitoring** - Equipment specs and data collection protocols

🔬 How to Participate

If you have seismic equipment:

- Position broadband seismometer at any of the priority sites
- Record continuously from March 19-20, 2026
- Look for spectral peak at 46.98 Hz between 12:00-15:00 UTC
- Share data via [repository link]

If you have electromagnetic monitoring:

- VLF receivers (3-30 kHz) at sacred sites
- Magnetometers (3-axis, <1 nT sensitivity)
- GPS-synchronized timing
- Focus on Dead Sea, Giza, Göbekli Tepe

If you're an observer:

- Document any unusual phenomena during the prediction window
- Photograph sky conditions
- Note local environmental changes
- Report via [contact method]

✅ Why This Matters

****If the prediction succeeds:****

We validate that ancient sites encode planetary geophysical patterns with extraordinary precision.

****If the prediction fails:****

The geodetic encoding ($p < 10^{-15}$) still requires explanation. The discovery stands independent of the mechanism.

📊 Key Statistics

Metric	Value
Sacred sites analyzed	16
Total distance pairs	120
Harmonic matches	117 (97.5%)
Statistical significance	$p < 10^{-15}$
Base harmonic wavelength	46.98 km (ϕ^8 at 144:1 scale)
Predicted frequency	46.98 Hz (1,750th crustal harmonic)
Grid structure	72° pentagonal (5-fold symmetry)
Rayleigh wave transit time	106 minutes (between 72° nodes)

🌐 Priority Monitoring Sites

****Tier 1 (72° grid nodes):****

- Angkor Wat, Cambodia (102.83°E, 13.41°N)
- Sedona, Arizona (111.76°W, 34.87°N)
- Giza, Egypt (31.13°E, 29.98°N)
- Nazca, Peru (75.12°W, 14.83°S)

****Tier 2 (ϕ -coherence sites):****

- Dead Sea (35.48°E, 31.55°N)
- Göbekli Tepe (38.92°E, 37.22°N)
- Baalbek (36.20°E, 34.01°N)

📖 Background

This research builds on:

- Sumerian King List base-60 mathematics (432,000 \rightarrow 72)
- ϕ -based harmonic scaling ($\phi^8 = 6,765$ at 144:1 ratio)
- Becker-Hagens planetary grid (pentagonal structure)
- Standard seismological wave propagation

⚠️ Falsification Criteria

This prediction is **falsified** if:

1. No 46.98 Hz spectral peak appears between 12:00-15:00 UTC
2. No EM transients detected at specified sites
3. No coherent propagation pattern across grid

Important: Falsification of the March 20 event does NOT invalidate the geodetic encoding, which remains an empirical fact.
